The planet Jupiter boasts the most spectacular light shows in the solar system, with colorful and shifting light displays that are the most intense anywhere. Jupiter's auroras are hundreds of times brighter than Earth's and last for hours, sometimes days. The auroras are caused by charged particles from Jupiter's powerful magnetic field interacting with the planet's atmosphere. The auroras are visible from Earth and are a popular sight for astronomers and space enthusiasts alike. The auroras are a testament to the power of Jupiter's magnetic field and the dynamic nature of the planet's atmosphere.

11179308

Exploring Europa and the possibility of life beneath its icy surface is one of NASA's top priorities. The Europa Clipper mission is set to launch in the late 2020s, and the Europa Lander mission is planned for the early 2030s. These missions will provide unprecedented insights into the moon's interior and the potential for life. The discovery of life on Europa would be a major breakthrough in our understanding of the universe and the search for habitable worlds.

NASA/JPL-Caltech

11179310

Trappist-1e is a small, rocky planet located in the habitable zone of the star Trappist-1, a red dwarf star in the constellation Aquarius. It is the only planet in the system that is thought to have liquid water on its surface. The planet is about the size of Earth and has a similar orbital period. It is a prime candidate for the search for life beyond our solar system.

NASA/JPL-Caltech

11179311

[Mars Colonization and Tourism Assoc.]

11179312

The Voyager spacecraft was launched in 1977 and is the only human-made object that has left the solar system. It has provided us with unprecedented views of the outer planets and is currently on its way to interstellar space. The spacecraft is expected to continue its journey for decades to come.

NASA/JPL-Caltech

11179314

Kepler-186f is the first Earth-size planet discovered in the habitable zone around another star. It is a rocky planet that is thought to have liquid water on its surface. The planet is about the size of Earth and has a similar orbital period. It is a prime candidate for the search for life beyond our solar system.
